## Element 2: Housing

A compilation of objectives, policies, goals, maps and programs of the local governmental unit to provide an adequate housing supply that meets existing and forecasted housing demand in the local government's jurisdiction. The element shall assess the age, structural value and occupancy characteristics of the local government's housing stock. The element shall also identify specific policies and programs that promote the development of housing for residents of the local governmental unit and provide a range of housing choices that meet the needs of persons of all income levels and of all age groups and persons with special needs, policies and programs that promote the availability of land for the development or redevelopment of low-income and moderate-income housing, and policies and programs to maintain or rehabilitate the local governmental unit's existing housing stock.

#  <br> <br> Element 2: <br> <br> Element 2: Housing 

## Introduction

Title VII of the Civil Rights Act of 1968 - also known as the Fair Housing Act - and subsequent amendments to that act, prohibit the sale, rental, and financing of dwellings and in other housing-related transactions, based on race, color, national origin, religion, sex, familial status (including children under the age of 18 living with parents of legal custodians, pregnant women, and people securing custody of children under the age of 18), and handicap (disability). It does not take a federal law to understand that housing is a basic need for everyone. To that end, federal law has, in recent years, taken a back seat to local initiatives to provide housing to people of all economic levels and backgrounds. Part of the local initiative is the result of the federal laws and part is the result of the desire at the local level of doing the right thing. Wood County communities have, historically, provided for all types of housing opportunities. Only 11 of the 22 towns have zoning ordinances and each of those allows for any and all types of housing. It is easy then to establish the goal of providing an adequate supply of affordable housing for individuals of all income levels and backgrounds throughout each Wood County municipality.

This planning element will review housing information such as number of housing units, age of those units, type of housing, housing values, housing costs, occupancy characteristics and other information that is useful in developing countywide housing policies. Using information gathered from that assessment, together with information from Chapter 2's analysis and projection of population, statements can be crafted regarding future housing opportunities
that can be expected to exist in Wood County during the planning period.

## Housing Assessment

## Type of Housing Structures

Wood County has 31,369 housing units ${ }^{1}$ More than three-fourths (75.6\%) of those units are 1unit, or single-family homes (Table 2-1). Interestingly, that is the exact proportion of singlefamily homes that was in the county 10-years earlier. Two-unit structures (duplexes) account for slightly over six percent of all housing units.

| Table 2-1 Dwelling Types - 2000 vs. 1990 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Type | 1990 |  | $\underline{2000}$ |  |
|  |  | Percent of Total Units |  | Percent of Total Units |
| Single Family (1-Unit) | 21,817 | 75.6\% | 24,241 | 75.6\% |
| Duplex (2-Unit) | 1,967 | 6.8\% | 1,963 | 6.2\% |
| MultiFamily (3 or more units) | 2,845 | 9.9\% | 3,635 | 11.4\% |
| Mobile Homes | 1,933 | 6.7\% | 1,838 | 5.8\% |
| Other | 277 | 1.0\% | 14 | 0.0\% |
| TOTAL | 28,839 | 100.0\% | 31,691 | 100.0\% |
| Source: U.S. Census 1990, Summary File 3, Table H020, 1990 and Table DP-4, Profile of Selected Housing Characteristics, 2000. |  |  |  |  |

There has been an increase in the proportion of housing structures that have three or more units in them. In 10-years, 840 new housing units are in the larger multiple-family structures for an increase in that style's proportion of Wood County housing from $9.9 \%$ in 1990 to $11.4 \%$ in 2000.

[^0]Nearly five percent are structures are large complexes with 20 -units or more. All larger structures are located in cities or villages that can provide municipal sanitary sewer and water. It is likely that more multiple family units will be built during the planning period as the population continues to age and moves into apartments, senior housing facilities or assisted living centers. Mobile homes also continue to have a significant proportion of the housing market with nearly six percent of the total housing units. Both the number of mobile homes and the proportion of housing units that are mobile homes decreased between 1990 and 2000. Part of the reason for the change in this housing segment may be that older mobile homes have been replaced by newer manufactured housing or on-site built homes. Mobile homes have been used as "hunting shacks" in the county and, as those become outdated, they are either eliminated or replaced with another type of structure.

Housing structures in the unincorporated areas of Wood County are served by private onsite waste treatment systems. For this reason, it is likely that the type of housing structures in Wood County's towns will continue to be mainly single-family, with some additional duplexes. Town officials must, however, be aware of the changing age of their population and with that, in some cases, changing needs or desires in housing types that may occur in the foreseeable future.

## Age of Housing Stock

The age of Wood County's housing stock is remarkably similar to the State's as a whole. About one in five housing units (21\%) in Wood County was built prior to 1940 compared to $23 \%$ in Wisconsin. On the other end of the scale, $26 \%$ of Wood County's housing units have been built since 1980. For Wisconsin, the figure is $28 \%$ for the same period.

As can be seen in Table 2-2, the towns have a higher proportion of newer homes than do the cities and villages. That stands to reason because it wasn't until the 1960s that the suburban movement began nationally and
locally. In the case of Wood County, $69 \%$ of the houses in unincorporated areas of the county have been built since 1960 and half of those have been built in the past 20-years.

There is also a breakdown between urban and rural towns in Wood County in Table 2-2. Seventy-five percent of all housing units in the towns are located in those that are defined, for this plan, as "urban area towns." One-third of the housing in rural area towns was constructed before 1940 compared to only $13 \%$ in urban area towns. Information in that table demonstrates how the suburban movement from the cities affected the towns in the County. Seventy-four percent of all housing units in the urban area towns have been built since 1960 and half of those were built between 1990 and 2000. The rural area towns have also felt the effects of the movement out of the cities, but not to the extent of those towns that are located adjacent to Marshfield or the Wisconsin Rapids area cities and villages. In the rural area towns, $54 \%$ of all housing units have been constructed since 1960 and $30 \%$ between 1980 and 2000. Natural growth also contributes to the growth in towns as resident family members build homes to stay in the areas where they were raised.

## Housing Quality

A measure of housing quality is provided by the U. S. Census Bureau with their reports on the status of plumbing facilities in housing units. Information in Table 2-3 was obtained from U. S. Census sample data tables. According to that data, nearly $100 \%$ of all Wood County housing units have complete plumbing facilities, regardless of whether those units are owner- or renter-occupied. The 52 owner-occupied housing units that lack complete plumbing facilities include "hunting shacks" and other recreation structures. Sixteen rental units have some plumbing deficiencies. It is not known if those are hunting or other recreation housing units or where they are located. The Wisconsin Plumbing Code and the Wood County Private Sewage Ordinance require that appropriate plumbing be installed for waste disposal and that

a County sanitary permit be obtained prior to building permits being issued by local units of government. Sanitary permits were first required in about 1970. The 1970 census indicated that $6.2 \%$ of all housing in Wood County had plumbing deficiencies. Only a fraction of one percent had deficiencies in 2000, showing that the modern plumbing codes have succeeded in ensuring that habitable structures have adequate and appropriate plumbing.

## Value Characteristics

## Value of Homes

The structural value of owner-occupied housing the year 2000 in Wood County is listed in Table $2-4$. The majority of homes (57.4\%) in the County have a value of between $\$ 50,000$ and $\$ 99,999$. Statewide, $35.4 \%$ of the homes fall into this value category. In Wisconsin, over 30\% of all homes are between $\$ 100,000$ and \$149,999 and 15.5\% are between \$150,000 and $\$ 199,999$. Fewer than $6 \%$ of Wood County homes were at the $\$ 150,000-\$ 199,999$ value. Likewise, Wood County had a much lower proportion of homes valued between \$200,000 and $\$ 299,999$ than did the State as a whole. These figures indicate, then, that the cost of housing in Wood County is much lower, or more
affordable, than elsewhere in Wisconsin.
Within Wood County, a greater proportion of higher valued housing (i.e. \$100,000 to $\$ 299,999$ ) is located in the towns, while a higher proportion of housing valued at less than $\$ 100,000$ is in the villages and cities. There are a couple of logical reasons for this. First, areas that became the cities and villages developed before the towns and at higher densities because those were the areas where jobs and services were located. Consequently, the older, lower value homes are in those incorporated communities. Second, the suburban movement of the 1960s contributed to larger homes with higher values in the unincorporated towns. In more recent years, residential development in the towns has been on larger lots with bigger homes. Towns will likely continue to have the higher value homes unless high gasoline and fuel costs force more new or quality restoration development in the cities and villages. Many older homes in the cities and villages have been renovated, but the value has not increased to the extent of the new, larger rural homes, plus the number of replacement homes in the cities and villages has not been enough to increase that community's proportion of higher value homes. Finally, as noted in the previous chapter, there has been a slight trend reversal

Source: U. S. Census 2000, Table DP-4.
with rural areas gaining back a larger proportion of the County's population.

## Housing Affordability

Another indicator of the affordability of housing is the percentage of household income that is spent on housing costs. The generally accepted standard is that no more than $30 \%$ of the household's income should be spent on housing costs. Sample data was computed as part of the census to try to determine the status of housing costs relative to income. Figures for owner-occupied housing for Wood County; town city and village totals and state figures appear in Table 2-5. On a countywide basis, $10.8 \%$ of the households spend more than $30 \%$ of their income for housing. Statewide, $17.8 \%$ spend more than $30 \%$ of their income for housing costs. The current economic recession is likely causing these numbers to rise as members of many households lose jobs or are faced to take lower pay to keep their jobs.

Renters tend to spend more of their incomes for housing than do those who own their homes (Table 2-6). There are a number of socioeconomic factors that may contribute to this and the factors in Wood County may vary somewhat from the factors at the state level. In Wood County, renters may have lower income levels and, consequently, can not or have not saved enough to purchase a home. There are growing
numbers of retired and elderly people who prefer to rent, especially where they are not responsible for maintenance of housing structures. Perhaps those who have lost their jobs in as a result of the depressed economy have been forced to sell their homes and rent less expensive housing. Whatever the reason, $28.1 \%$ of Wood County's renters paid $30 \%$ or more of their income for housing in 2000. Although not as high as the State's $32.3 \%$, it is substantially higher than the owner-occupied housing figures. Again, these figures have probably gone up since 2000 as the economy has floundered.

## Occupancy Characteristics

Housing units are either occupied or vacant. Total housing units, as discussed above, include both occupied and vacant units. There were nearly 5,700 more housing units in 2000 than there were in 1980 (Table 2-7). The proportion of owner-occupied, renter-occupied and vacant units has remained stable throughout that 20year history. Owner-occupied units make up about $70 \%$ of all housing, with renter-occupied units accounting for about 25\%. About five percent of all housing units in Wood County are vacant at any one time, but of the 1,556 vacant units reported in 2000, 244 (16\% of all vacant units) were reported to be for seasonal, recreational, or occasional use.

Source: U. S. Census 2000, Table DP-4.

Vacancy information is important because it shows the relative demand for a particular housing type. An owner-occupied rate below two or three percent indicates a tight market and unmet demand for additional new homes. A renter-occupancy rate below five percent indicates pressure on the rental market and the need for more rental units. In 2000, the vacancy rate of owner-occupied housing units was only $1.1 \%$, suggesting that there may not be enough homes to meet housing needs. The rental unit vacancy rate in 2000 was $5.8 \%$, indicating that an adequate supply of rentals is available.

| Source: U.S. Census of Population, Table DP-1. |  |  |  |  |

## Tenure

It is interesting to analyze the tenure of householders, or how long they have lived in their present home. Table 2-8 shows this data for Wood County. Of the owner-occupied housing units, $40.3 \%$ have lived in their home for five or fewer years and $56.8 \%$ for 10 or fewer years. County-wide numbers will usually indicate more population movement than unincorporated town numbers because the numbers for the County take into consideration a very large number of rental units, group homes,

| $\|l\|$ <br> Table 2-8 <br> TENURE BY YEAR HOUSEHOLDER <br> MOVED INTO UNIT <br> MOS <br> YEARS | WOOD COUNTY <br> (Pct. of Total) |

| Source: U.S. Census of Population, 2000, <br> Table DP-4. |  |

nursing homes, etc. that are located in cities and villages, but not in the unincorporated towns.

## Housing Trends

The number of dwellings has continued to increase in Wood County and while the proportion of single-family units has remained stable, the percent increase in the multi-family units has outpaced that of single-family units by $27 \%$ to $11 \%$. These and other trends are summarized in Table 2-9.

## Future Housing Needs

In the first chapter, it was projected that there will be 34,342 households in Wood County in the year 2025. That is an increase of 4,207 households over the 30,135 households in 2000.

Some of these households will be located on small city or village lots and some structures will have two or more households. Assuming that the unincorporated towns will continue to have $34 \%$ of the county's housing units as they had in 1980, 1990 and 2000, they will add about 1,430 units to their housing stock. If each of the rural housing units uses an average of two acres of land, an additional 2,860 acres of land in the towns will be converted from an undeveloped or agricultural use to residential uses between 2000 and 2025. This land will have to be set aside through proper planning and zoning for the needed housing.

## Figure 2-9 Housing Trends

## 1. Single-family housing

The proportion of single-family dwellings has remained constant at $75.6 \%$ of the housing stock.

## 2. Multiple-family housing

The number of housing structures with three or more units has grown more rapidly (+27\%) than single-family housing $(+11 \%)$. This trend is expected to continue as more senior housing units are added and as condominium development increases.

## 3. Urban towns are growing faster than rural towns

In rural towns, $33 \%$ of the dwelling units were built before 1940 compared to $13 \%$ in urban towns. Conversely, $37 \%$ of housing units in urban towns were built since 1980 compared to $30 \%$ in rural towns.
4. Higher value housing is being built in the unincorporated areas

Ten percent of housing in the towns is valued at $\$ 150,000$ or more compared to $7.5 \%$ in villages and $3.5 \%$ in the cities.

## 5. Wood County housing is affordable

Only $10.8 \%$ of Wood County residents spend more than $30 \%$ of their household income for housing compared to nearly $18 \%$ statewide. Housing is Wood County is more affordable in the cities and villages than in the towns for owners, but the opposite is true for rentals.

## 6. The proportion of owner-occupied housing has remains constant

Owner-occupied housing makes up about $71 \%$ of all housing units and rentals make up nearly $25 \%$. These percentages have remained constant since 1980.

## Goals \& Objectives

The goals and objectives listed below are not prioritized.
A. Goal: Provide sound, healthy and affordable housing for all residents at all income levels.

1. Encourage multifamily developments to locate in the cities and villages that can provide needed sewer and water services.
2. Designate adequate land for the construction of new single-family houses in the towns while protecting active agricultural lands and environmentally sensitive lands from encroachment of new residential development.
3. Take advantage of state and federal programs to assure an adequate supply of housing types for low- and moderate-income families.
B. Goal: Provide housing types to accommodate the needs of our aging population.
4. Encourage senior housing, assisted living centers and nursing homes to locate within easy access to essential services, such as medical centers, hospitals, churches, shopping areas, grocery stores, etc.
5. Encourage housing contractors to incorporate basic accessible housing features so our seniors can enjoy a high quality of life in their own homes as long as possible.
C. Goal: Increase the supply of sustainable housing in the county.
6. Use state and federal programs to modify existing housing units to use less energy for heating and cooling, and to use alternative energy types.
7. In addition to alternative energy choices, encourage "green" housing with the use of renewable construction materials, as well as those that do not have a negative impact on our natural resources.

[^0]:    ${ }^{1}$ U. S. Census 2000, Table DP-4, Profile of Selected Housing Characteristics: 2000.
